Wispy Opalescent

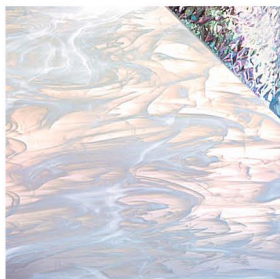

Spectrum Glass

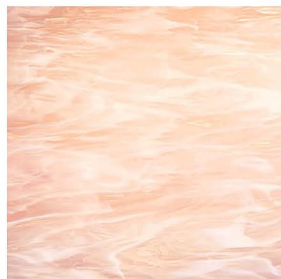

Spectrum Glass
Company

Spectrum's Wispy Opalescent are traditionally composed of about 3/4 cathedral glass colour and about 1/4 opaque white glass. The white opal is hand-ladled into a moving stream of cathedral colour. The two glasses are then stirred together, by hand, just before the sheet is formed. In the finished sheet, wisps of opal display as both surface variegation and internal shadowing, generating reflection and depth.
